

Guide to Cybersecurity

It's a Matter of When, Not If

Statistics show that nearly every organization—and especially nonprofits—are going to be hacked at some point. It is not a matter of if you'll be hacked, but when, and how impactful the incident will be.

How can you prepare?

The Human Firewall

Training yourself and your employees to recognize phishing attempts is the first line of defense.

Strong Passwords

Creating a strong and unique password is a great step in warding off ill-intended hackers.

Multi-Factor Authentication

When it is set up correctly, multi-factor authentication significantly decreases the success rate of a cyberattack.

Virtual Private Networks

A Virtual Private Network (VPN) is one piece of the security and cyber-protection puzzle that can provide a great deal of security gain with a very small amount of effort.

Seek Assistance

A true, comprehensive, security strategy is comprised of multiple layers of purpose-built tools and consistent monitoring. If that is beyond your scope and ability, consider hiring a trusted MSP like Connect Cause.
